

Magento Secure Payment Bridge

Helping Merchants Achieve PCI Compliance

Magento Secure Payment Bridge assists merchants in meeting PCI standards with this Payment Application-Data Security Standards (PA-DSS) compliant payment application. Implementing Secure Payment Bridge with Magento Enterprise saves online merchants money and time when it comes to complying with PCI DSS Standards.

Understanding PA-DSS

If a software application stores, transmits or processes sensitive cardholder data the application must be PA-DSS compliant.

- Requires all payment applications be certified by an approved Payment Application-Qualified Security Assessor (PA-QSA), such as Magento industry partner, Coalfire.
 - PA-QSAs are third-party security auditors, certified by the PCI-Security Standards Council (PCI-SCC) to verify that payment applications meet specified security standards.
- PA-DSS payment applications must be implemented in a PCI DSS compliant environment.

Impact of Non-Compliance

- All payment applications must be PA-DSS compliant by July 1, 2010.
- Non-compliance can mean risk of audits or fines or possibly that credit card companies will remove the ability for a merchant to process payments entirely.

Making Compliance Easy

Magento has helped make PCI DSS compliance easier for merchants by separating the Magento Secure Payment Bridge application from the Magento Enterprise platform. There are two important benefits of this design:

- Only the actual payment application has to be certified and compliant - rather than the entire platform.
- Magento Enterprise can be upgraded and customized without affecting the overall PA-DSS compliance provided by Secure Payment Bridge.

Magento Enterprise with Magento Secure Payment Bridge will help you achieve PCI compliance and put your customers at ease.

Magento Secure Payment Bridge is compatible with Magento Enterprise 1.8, 1.9, 1.10 and 1.11.
